

External and internal parasite treatment (dogs and cats)

This information can be printed and supplied to your preparing veterinarian though they must check and ensure that they strictly follow the manufacturer's directions in relation to the re-application interval for the product they choose. The product must be registered in the country of export for use in the intended species (cat or dog) for the control of fleas and ticks. Where re-application intervals for fleas and ticks differ, the shortest re-application interval should be adhered to.

If you believe another treatment not listed below may be appropriate please contact the department prior to use.

Tick collars are not an acceptable method of external parasite treatment because the collar can be removed and/or may not be effective in adverse weather.

Medications of the isoxazoline class (for example, oral and topical Bravecto, oral Nexgard, Simparica and Credelio) and certain topical treatments such as selamectin (Revolution) for external parasite control are not acceptable because they require the tick or flea to bite the animal before they are affected by the product. When they bite the animal they can transmit diseases and therefore these products do not comply with Australia's import policy.

External parasite treatments for dogs

Active ingredient	Example brand names
Fipronil	EFFIPRO spot on solution for dogs, My Flea Guard, Pestigon, Eliminal Fleatix (Spot on) for dogs
